## CANDIDATE'S DECLARATION

I hereby certify that the work which is being presented in the thesis entitled **Automated method based on TQWT for the classification of alcoholism using EEG signals** in the partial fulfilment of the requirements for the award of the degree of **MASTER OF TECHNOLOGY** and submitted in the **DISCIPLINE OF ELECTRICAL ENGINEERING Indian Institute of Technology Indore**, is an authentic record of my own work carried out during the time period from JUNE 2019 to JUNE 2020 under the supervision of Prof. Ram Bilas Pachori Professor at IIT Indore.

The matter presented in this thesis has not been submitted by me for the award of any other degree of this or any other institute.

**Signature of the student with date  
(BORRA JEEVAN TEJA)**

-----  
This is to certify that the above statement made by the candidate is correct to the best of my/our knowledge.

12.07.2020

Signature of the Supervisor of  
M.Tech. thesis (with date)  
(Prof. Ram Bilas Pachori)

-----  
Borra Jeevan Teja has successfully given his M.Tech. Oral Examination held on **23<sup>rd</sup> June 2020**.

Signature(s) of Supervisor(s) of M.Tech. thesis  
Date: 12.07.2020

Signature of PSPC Member #1  
Date: 12.07.2020 Dr. Pavan K. Kankar

Convener, DPGC  
Date: 12-07-2020

Signature of PSPC Member #2  
Date: 12.07.2020

## **Acknowledgements**

First of all, I would like to express my sincere gratitude to my thesis supervisor **Prof. Ram Bilas Pachori** for his constant support, encouragement and guidance during my master's study and thesis work. Furthermore, I would like to my deep gratitude to my PSPC members **Dr. Pavan Kumar Kankar** and **Dr. Vivek Kanhangad** for their valuable suggestions and feedback.

I would also like to thank all the faculty members and the staff at **IIT Indore** for their cooperation throughout my study and thesis work. I would like to thank the Discipline of Electrical Engineering for providing all the facilities, resources, and research environment required for the completion of this work.

I would like to thank all the members of **Signal Analysis Research Lab** for their assistance at various levels of this work.

I am grateful to all my colleagues for their constant support, fruitful discussions, and making my stay at the institute enjoyable.

I am especially grateful to my family members for their invaluable support and strong belief in me. Their sacrifices and unbounded love motivate me to remain focused and determined, which always pushes me to strive for excellence. I dedicate my Master's thesis to my great parents for their countless sacrifices.

**BORRA JEEVAN TEJA**

# Abstract

Alcoholism is a seriously addicted habit to most of the youth in the present days. It is very necessary to find and diagnosis the alcohol addicts as most of them did not realise that they are affected by the alcoholism. In old days it is very difficult to find the affected people by conducting manual question and answer sessions. But recent studies found that alcoholism have significant effects on EEG signals that can be extracted from using different computerised methods. In this thesis we have discussed one of the methods to find the alcoholism from electroencephalogram (EEG) signals. First, we have decomposed the EEG signals by using tunable Q factor wavelet transform (TQWT) in to different sub bands and determine the energy of each sub band. Then we extracted features from different sub bands using Hurst exponent, log energy, Shannon entropy, approximate entropy, threshold entropy, and normal entropy. Then we have used various classifiers to classify the effected and non-effected EEG signals from the extracted features. Then we compare different combination of features and classifiers to get the best results. In this method we have got an accuracy of 99.2% with and area under curve (AUC) of 0.99 for the Shannon entropy and logistic regression combination.

# Chapter 1

## Introduction

### 1.1 Alcoholism

Alcoholism is considered as mental sickness by the diagnostic and statistical mental disorder [1]. In recent day it is easy to addicted to alcoholism without knowing it. Generally, the person suffering from alcoholic addict have difficulty in controlling their desire to take alcohol. Most of them are fully aware of the harmful effects of alcohol but they are unable to control that habit and even they don't want others to know that they are having this addiction. In recent studies by world health organisation (WHO) alcoholism is declared as the fifth highest mortality rate among the deadliest diseases in the world [2]. And the early alcoholic deaths and moderate alcoholic deaths are more in recent days. Moreover, alcohol consumption reportedly increases the disability adjusted life year (DALY) and even lead to death. It is reported that 6% of deaths are due to alcoholism which is approximately around 3.3 million per year [30]. Addiction of alcohol may cause serious health issues like liver cancer, oesophagus cancer and oral cancer etc. And alcohol effects the personal life like relationships with work place and social

gatherings. Excessive taking of alcohol causes physiological and behavioural changes in that person, and serious damage to the nervous system and may cause disability in learning and academic performances.

It is very hard to recognize the alcoholism cases by conventional methods. Normally, it is diagnosed in clinics and primary health care centres by assessing responses to irritation by cutting down, first drink in the dawn, guilty feeling, and criticism. But it was found that its rate of positive screening of alcoholic subjects is lower than 50% using these questions [3]. The reason for few patients not sharing the correct information might be due to anxiety of stigmatization and shame. In recent studies revealed that, electroencephalogram (EEG) signals can acquired non-invasively depict the state of brain and they can be effectively used for the detection, identification and treatment monitoring of the alcoholic patients [4].

## 1.2 EEG signals

From the research that has been conducted for establish and exploring the effect of alcoholism on EEG signals such that they will be used for the neurophysiological studies. These assessments have shown considerable clinical relation between EEG signals and alcohol usage. The alcoholic subjects have differences in the power spectrums of the delta (0–4 Hz), theta (4–7 Hz), alpha (8–12 Hz), gamma (>30 Hz) and beta (12–30 Hz) frequency sub bands in EEG signals [5]. In addition, with the above effects, the subject experiences changes in behaviour like seizures and hallucinations [6,7,8]. By finding out the variations in power level of the frequency sub bands in EEG signals, neurophysiological studies can be possible. Research on alcoholic subjects concludes that the EEG signals shows higher beta wave, delta wave and theta wave [60] power as compared to normal subjects. And increase in the beta 3 (20–28 Hz), beta 2 (16–20 Hz), and beta 1 (12–16 Hz) frequencies in EEG signals are the caused for parietal and frontal region of the alcoholic subjects. The results from Bauer's study on these subjects have showed a considerable change in beta activity within the frequency range of 19.5 to 39.8 Hz. The lower dose of alcohol which is below 0.5 g/kg can impact task related synchronization in theta frequency bands of EEG signals, and usage of alcohol in moderate dose may increase the power in alpha band (8–12 Hz). With the changes that are in EEG alpha topographic localization, activity, morphological nature and generalized cortical processes within our brain will get modified. And high dosage of alcohol which means exceeding 1.0 g/kg can

increase activity of the EEG frequencies which are below 8 Hz. For this level of dosage, the lower delta spectral power and fast beta have been observed in low-binge and non-binge drinkers in contrast with the high-binge drinkers and added synchronization in gamma as well as theta frequency bands [9-10].

### **1.3 Overview of the existing techniques**

In the process based on computer-aided diagnosis (CAD), signal processing techniques such as nonlinear dynamics, wavelet transforms, and chaos theory are dominantly used in feature extraction methods. More-over, artificial intelligence algorithms such as enhanced probabilistic networks, neural networks, support vector machine (SVM) and principal component analysis (PCA) are used to determine minute changes in given signal and the diseases can be automated diagnosis. The nonlinear and linear methods such as fractal dimension, entropies, correntropy [11] and largest Lyapunov exponent are extracted for detecting the deviation from the normal [12].

### **1.4 Objective**

The main objective of this study is that to compare the different features that are extracted from the alcoholic and controlled EEG signals. And find the best accuracy possible using different kind of classifiers. The selected EEG signals are

decomposed using TQWT, and from the selected sub bands we have to extract different features and then we have to compare them.

## **1.5 Organization of thesis**

The arrangement of the remaining chapters in this thesis is as follows:

In chapter 2 firstly we have discussed about the TQWT and then we have explained theoretically about the features that are going to be extracted.

In chapter 3 the proposed methodology is shown and explained in detailed, along with various machine learning classifiers used, and also the performance merits are discussed.

In chapter 4 the experimental evaluated results are compared for various classifiers and the results are discussed by comparing performance indices.

In this final chapter 5 the thesis is concluded and the scopes for the future works are also discussed.

# Chapter 2

## Theory related to TQWT, feature extraction methods

### 2.1 Tuneable Q factor wavelet transform

The transform, that we denoted as the tuneable-Q wavelet transform (TQWT) [13], is controlled by its oversampling rate (redundancy) and the Q-factor. The TQWT is developed using perfect reconstruction over-sampled filter banks with scaling factors that are real-valued. There are two forms in this transform. The first form is for the discrete-time signals having finite length and can be implemented effectively with fast Fourier transform (FFT). The second form is for the discrete-time signals which are defined on all of  $Z$ . Modest oversampling rates (e.g. 3-4 times over complete) are sufficient for the synthesis/analysis functions of the TQWT can be localized well [14].

The TQWT I mostly related to the rational dilation wavelet transform (RADWT). Similar to the RADWT, the TQWT is also fully discrete, and has the perfect reconstruction property, is developed in terms of iterated two-channel filter banks, is modestly overcomplete, and implemented using the discrete Fourier transform (DFT). In contrast to the RADWT, the TQWT is conceptually simpler, and can also be more effectively

implemented by the radix-2 FFTs, and the parameters are easily controllable to the Q-factor of transform. The user can directly control the redundancy and Q-factor of the TQWT [15].

The filters, on which the TQWT is based, are specified directly in the frequency domain, they don't have rational transfer functions. Similar to the fractional spline wavelet transform that is also based on filters which are having non-rational transfer functions, the DFT provides 1) a means to define the transform for finite-length discrete data that preserves the perfect reconstruction property exactly and 2) an effective implementation of the signal using FFTs [16].

The high pass and low-pass sub-band signals created after J-stages having the frequency responses given by  $H_1^{(J)}(\omega)$  and  $H_0^{(J)}(\omega)$  respectively as follows:

$$H_0^{(J)}(\omega) = \begin{cases} \prod_{m=0}^{J-1} H_0\left(\frac{\omega}{\alpha^m}\right), & |\omega| \leq \alpha^J \pi. \\ 0 & \alpha^J \pi < \omega \leq \pi. \end{cases} \quad (1)$$

$$H_1^{(J)}(\omega) = \begin{cases} H_1(\omega/\alpha^{J-1}) \prod_{m=0}^{J-2} H_0\left(\frac{\omega}{\alpha^m}\right), & (1-\beta)\alpha^{J-1}\pi \leq \omega \leq \alpha^{J-1}\pi \\ 0 & \text{otherwise.} \end{cases} \quad (2)$$

Where

$$H_0(\omega) = \theta \left( \frac{\omega + (\beta-1)\pi}{\alpha + \beta - 1} \right), \quad (3)$$

$$H_1(\omega) = \theta \left( \frac{\alpha\pi - \omega}{\alpha + \beta - 1} \right). \quad (4)$$

Here  $\theta(\omega)$  is frequency response of Daubechies filter bank and can be given as follows

$$\theta(\omega) = 0.5(1 + \cos(\omega))\sqrt{2 - \cos(\omega)}, |\omega| \leq \pi. \quad (5)$$

The parameters Q and r are given as,

$$r = \frac{\beta}{1-\alpha}, \quad (6) \quad Q = \frac{2-\beta}{\beta}. \quad (7)$$

By selecting proper values of Q and r we can control the characteristics of filter by which we can also control the decomposition of the given EEG signal [17].

## **2.2 Features selection**

### **2.2.1 Hurst exponent**

To calculate long term memory of time series we generally use Hurst exponent [18]. It belongs to the autocorrelations of time series, and decrease rate when raising difference between value pairs lags. Theories which have this exponent are actually originally developed in hydrology sector for the practical matter of finding optimum dam size for the great Nile river (in Africa) volatile rain and droughty conditions that has been studied over a long period. The name "Hurst exponent", or "Hurst coefficient", was from Harold Edwin Hurst (1880–1978), he was a lead

researcher in these studies; and the use of the standard notations H for the coefficient also related to his name.

The mentioned Hurst exponent is referring as a "index of dependence" or the "index of long-range dependence". It classifies the relative tendency of the time series either to converge strongly to the mean or to cluster in a specific direction. The value H is usually in the range 0.5–1 which indicates a time series with long-term positive autocorrelation, which means both that a high value in a series shall probably be following by another high value and that values a very long time into future shall also tend to be high [19].

The values in the range of 0 – 0.5 indicates a time series with long-term switching between higher and lower values in aside by side pairs, which means that a single higher value will probably be following by a lower value and thus the value after that shall tend to be very high, with this tendency to change between higher and lower values lasting a longer time into future work [20].

The value  $H=0.5$  will indicate a completely uncorrelated time series, but actually in facts it is the most value applicable to time series for which this autocorrelation at small time lags will be a positive or a negative value but where the absolute values of an autocorrelations decay exponentially quickly to zero [21-26].

Hurst expanded for variation range (R), standard deviation (S) the equation by Einstein which converts it to the more generic form as,

$$(R/S)^n = c \times n^H \quad (8)$$

Usually, the value  $R/S$  changes with the scale with an increase of a time increment according to this dependence degree equal to  $H$  which is otherwise the Hurst exponent.

### **2.2.2 Approximate entropy**

Functions [27] which verify the additive-type property is well related for efficient finding of binary-tree structures and also the fundamental splitting property of wavelet packets decomposition. Classically the entropy-based criteria match these mentioned rules and describe data-related properties for a precise representation of a signal. Entropy is a common concept mentioned in many areas, mainly in field of signal processing. Many others are available and will be easily introduced. If the signal is given then the coefficients of signal are in an orthonormal basis [28].

In this subject like statistics, approximate entropy (ApEn) is a method used to measure the amount of regularity and ‘unpredictability’ of fluctuations over given time-series. Regularity is actually originally measured by precise regularity statistics, which has mainly focused on different entropy measures. But accurate entropy calculation needs large amounts of data, and found results shall be fully influenced by system noise, so it is not practical or preferable to apply these methods to experimental data. To find approximate entropy, the below algorithm steps must be used [29].

1: - Form the given time series data say “v(1), v(2).....v(N)”. These are raw data values from measurement equally spaced in time.

2: - keep the 'm' constant and, an integer, and 'r', as a positive real number. The given value of 'm' must represent the length of compared run of given data, and 'r' also specifies a filtering level.

3: - From the above data make a sequence of vectors “x(1),x(2)....., x(N-M+1)” where x(i) = [v(i),v(i+1),.....v(i+m-1)]

4: - Apply the above sequence to construct, for each of 'i' where

$$1 < i < (N-m+1)$$

$$D_i^m(r) = \frac{\text{number of } x(j) \text{ such that } c[x(i), x(j)] \leq r}{N-m+1} \quad (10)$$

$$c[x, x^*] = \max |u(a) - u^*(a)| \quad (11)$$

$$\Phi^m(r) = (N - m + 1)^{-1} \sum_{i=1}^{N-m+1} \log(D_i^m(r)) \quad (12)$$

$$\text{Approximate entropy} = \Phi^m(r) - \Phi^{m+1}(r) \quad (13)$$

### 2.2.3 Shannon entropy

Functions which are having an additive type property are well suited for efficient searching of the fundamental splitting. Classical entropy criteria will mostly match the conditions and describe about information-related properties for an accurate representation of the given signal. Entropy for any signal is common concept, mostly in signal processing techniques [30-34].

The (nonnormalized) Shannon entropy is given by,

$$E1(x_i) = X_i^2 \log (X_i^2) \quad (14)$$

so

$$E1(x) = \sum_i X_i^2 \log (X_i^2) \quad (15)$$

with the convention  $0 \log (0) = 0$ .

In the above expression  $X$  is the signal and  $(X_i)$  are the coefficients of  $X$  in an orthonormal basis [35].

## 2.2.4 Log energy entropy

This log energy implies the logarithmic energy, which is also a notable feature for EEG signals classification. This has its base in potential theory. The log energy for a signal is found using basic Parseval energy theorem [36].

Let  $x(t)$  is the signal and we need to find its log energy value LOEN then, for ‘ $K$ ’ frequency bins and ‘ $l$ ’ frame indices

$$LOEN = \log E_x(l) \quad (16)$$

$$E_x(l) = \sum_{k=1}^K |x(k, l)|^2 \quad (17)$$

## 2.2.5 Threshold entropy

The threshold entropy is defined as,

$$E (X_i) = 1 \text{ if } |X_i| > p \text{ and } 0 \text{ otherwise so}$$

$E(X) = \#\{i \text{ if and only if } |X_i| > p\}$  is the number of time instants where signal magnitude is greater than the given threshold value  $p$  [37].

### 2.2.6 Norm entropy

The norm entropy with  $1 \leq p$  is given as,

$$E(X_i) = |X_i|^p \text{ so} \quad (18)$$

$$E(X) = \sum_i |X|^2 = \|X\|_p^p \quad (19)$$

In the above expression  $X$  is the signal and  $(X_i)$  are the coefficients of  $X$  in an orthonormal basis [38].

## 2.3 Summary

In this chapter we have discussed about TQWT, and different features that are going to be used in the proposed method theoretically. In the next chapter we are going to discuss about the proposed method with the required waveforms and graphs.

# Chapter: 3

## Datasets and proposed method

### 3.1 Introduction

In this chapter first we are going to discuss about the data set that we going to use. And then we are going to decompose the EEG signals using TQWT and we will calculate the energy of each sub band. Then we have to select the sub bands that are having significant energy. From that selected sub bands, we have extracted features that are discussed in the previous chapter. From the extracted features we have classified using different classification techniques.

### 3.2 Dataset

The EEG dataset used in this work was taken from the University of California, Irvine Knowledge Discovery in Databases (UCI KDD) archive. And it is available in online at the following <http://kdd.ics.uci.edu/databases/eeg/eeg.data.html>. This dataset is used to find relation between EEG signals and the correlation to alcoholism. This Dataset includes the EEG recordings of 124 alcoholic and normal patients captured from entire 10/20 standard sites or international montage in coordination with Standard

Electrode Position Nomenclature of American Electroencephalographic Association, 1990. The electrode attached to nose is used for ground. The electrode impedance is always less than 5k. All of these subjects have gone through 120 trials for different stimuli and that consists of 90 images of objects that were selected from the images from references [39-42]. These EEG signals have event related bio potentials obtained from 64 electrodes that are applied on scalp. The EEG signals are recorded for 32 s with cap (Electro cap Inter-national, ECI) having 61-lead electrode. The system was sampled at 12 bits resolution and 256 Hz. The EEG signals with undesired body and eye movements have been excluded and 30 recordings for each alcoholic and normal class are considered. This data uses 120 EEG signals of each normal and alcoholic class. All of these EEG signals have 2048 samples recorded for 8 s. The Figure 3.1 shows the example of the alcoholic and normal EEG signals respectively [43-46].

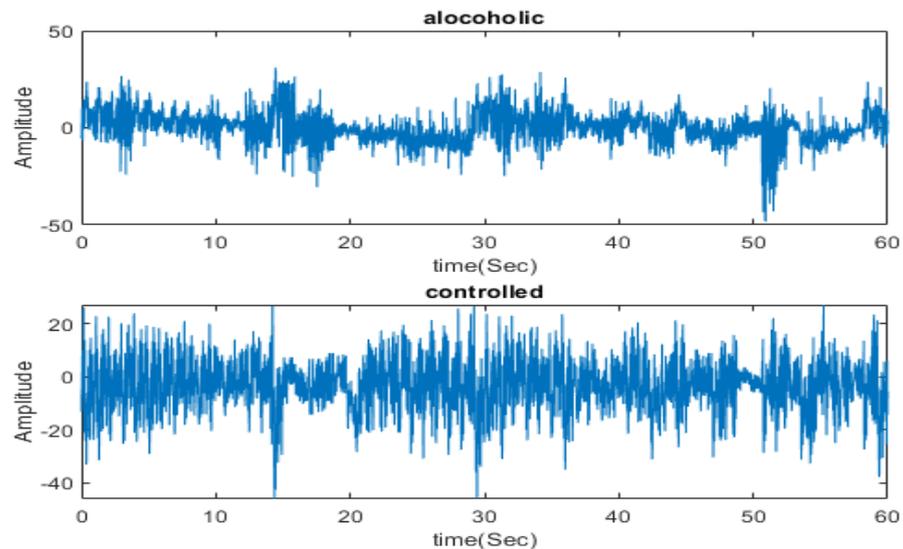

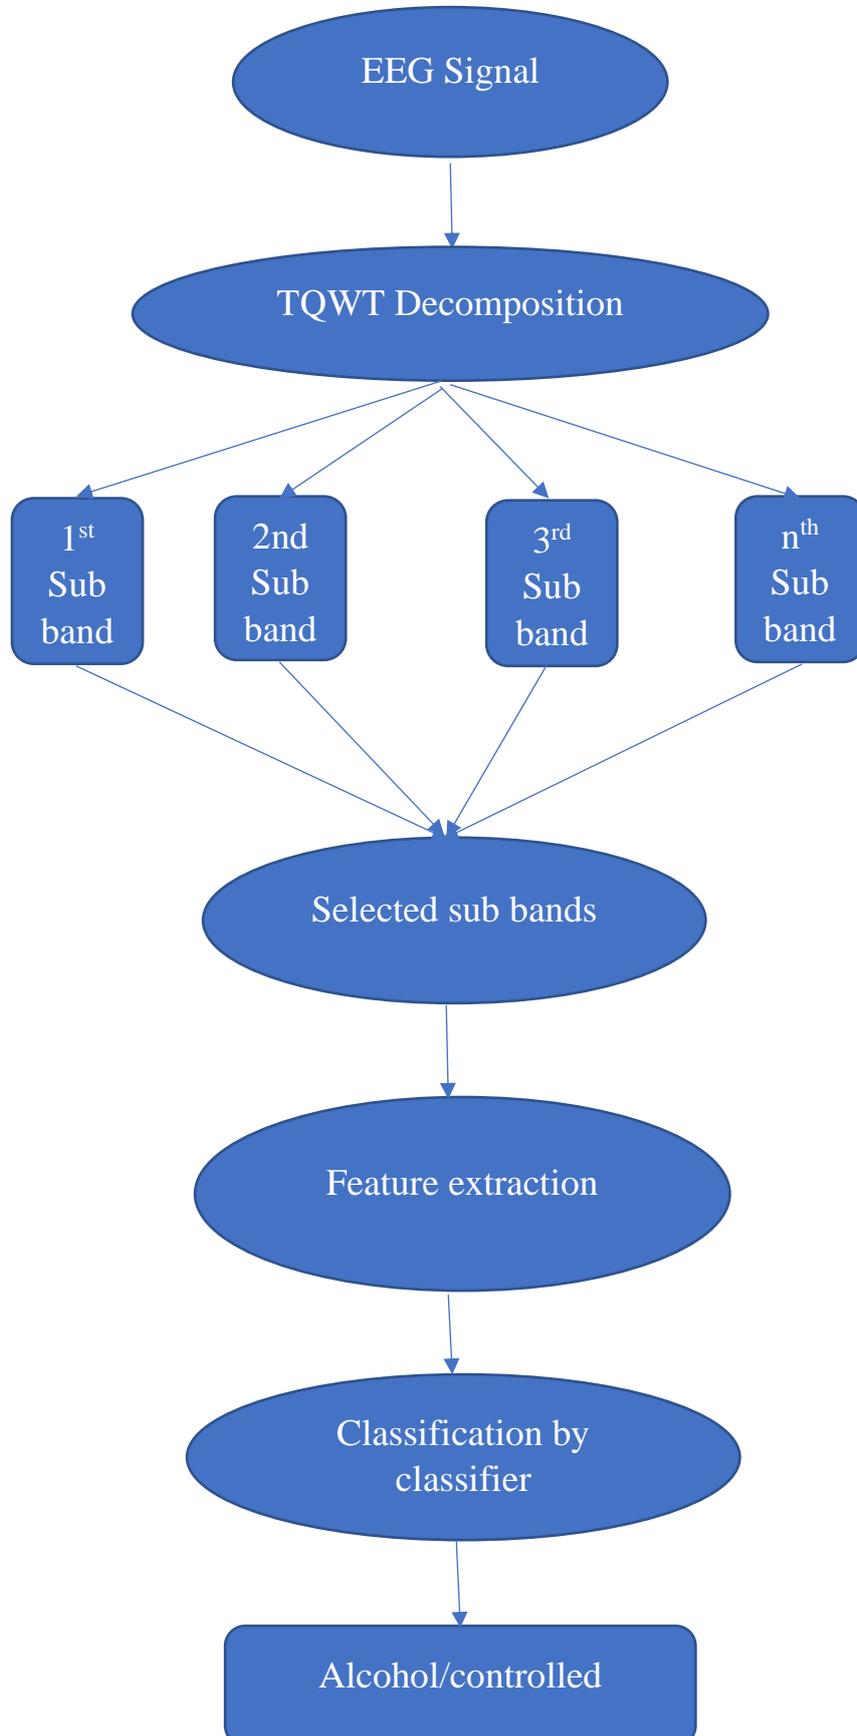

Figure 3.1 EEG dataset alcoholic and controlled

### 3.3 Proposed method

The flow chart of the proposed methodology is as follows:

### 3.3.1 Decomposition of EEG signal using TQWT

The EEG signals are decomposed using TQWT with the values of  $r = 3$ ,  $J = 8$  and  $Q = 1$ . And the decomposed sub bands are as follows shown in Figure 3.2.

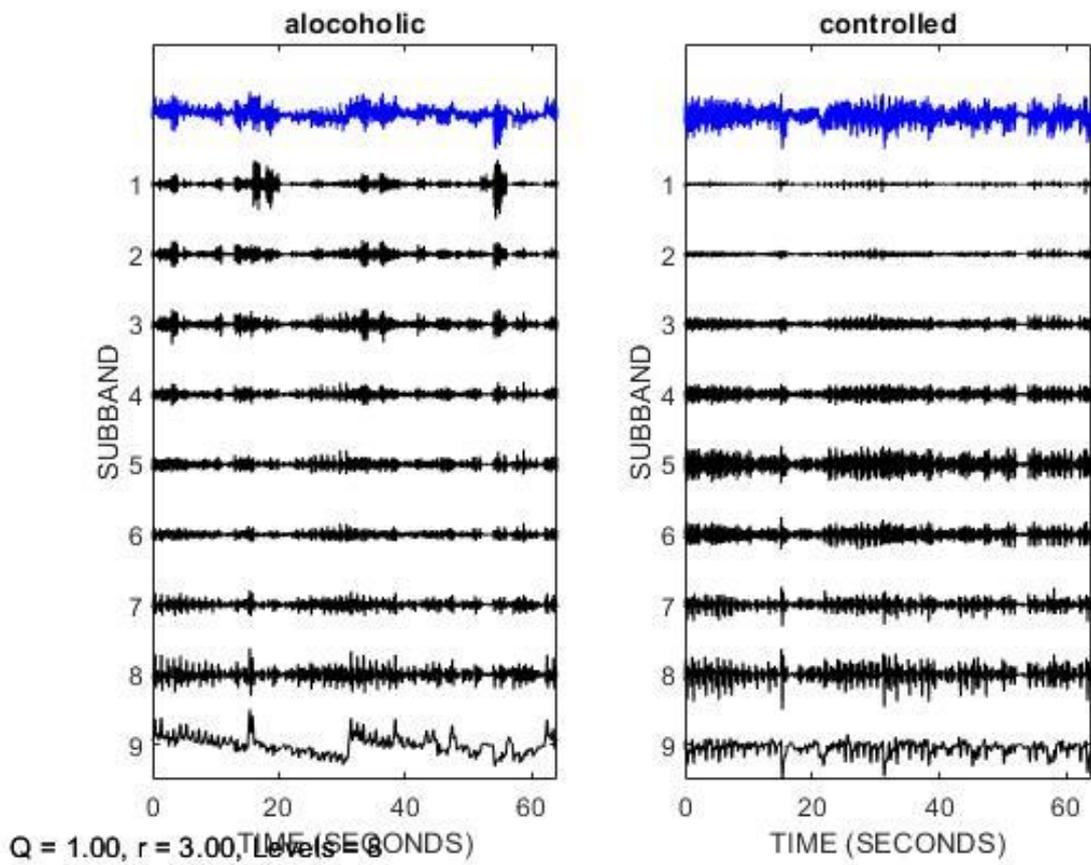

Figure 3.2 Decomposed sub bands using TQWT

### 3.3.2 Sub-band energy and selection

First, we have to calculate the energy of each sub band to understand which sub band has the maximum significant energy and then we have to select sub bands accordingly [47-49].

The energy of each sub band is shown in Fig 3.3.

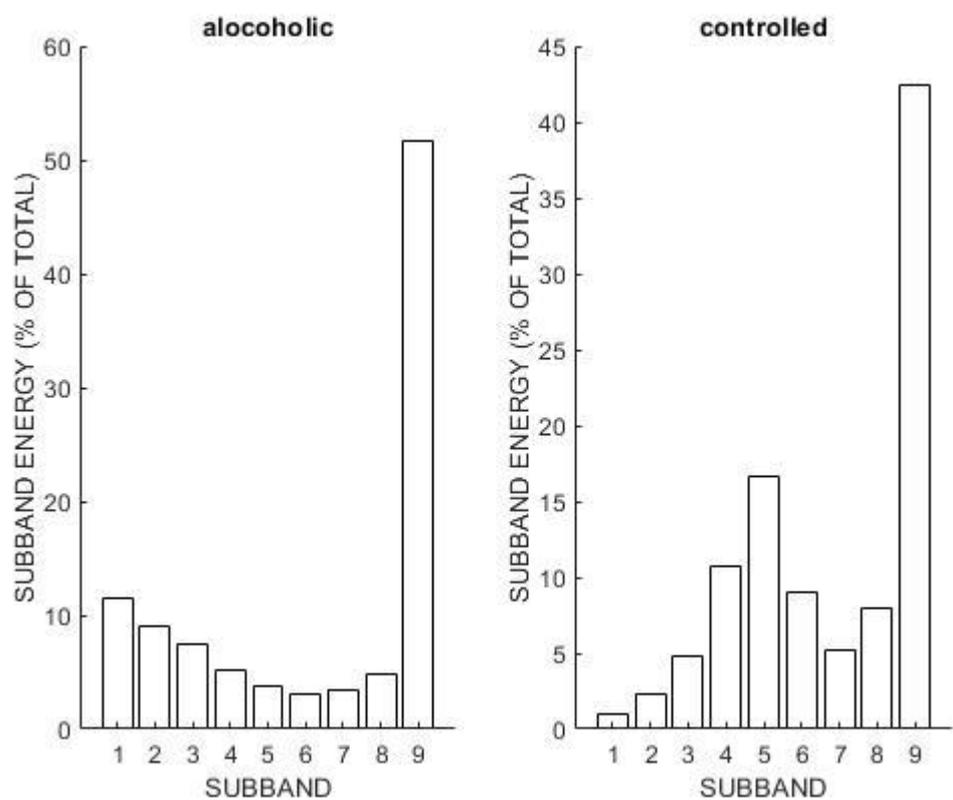

Figure 3.3 Energy of sub bands

From the energies that are calculated from the sub bands we have noticed that maximum change in energy is in lower sub bands as compared to higher sub bands so we can ignore the higher sub bands even though they contain more energy.

### **3.3.3 Extraction of features**

Now from the selected sub bands we have to extract the features namely Hurst exponent, approximate entropy, Shannon entropy, log energy entropy, threshold entropy and norm entropy. The features that are acquired from the sub bands is shown in the chapter: 4 results and discussion.

### **3.4 Summary**

In this chapter we have discussed about the dataset that is used in this method, the proposed methodology with the decomposed sub bands using TQWT, the energy of the sub bands and sub band selection based on the energy of sub band, and the features that are being used in this method. In the next chapter we will discuss about the results.

# Chapter 4

## Results and discussion

### 4.1 Tested values of all features

The following are the tested values of the features extracted from the sub bands using different entropy techniques namely Hurst exponent, log energy entropy, Shannon entropy, norm entropy and threshold entropy.

The following are the values of Hurst exponent. In the Table 4.1.1 and Table 4.1.2 we have shown the values of Hurst exponent for one controlled and one alcoholic respectively signal which is decomposed using TQWT.

Table 4.1.1 Tested values of Hurst exponent (alcoholic)

| Hurst exponent | Tested values |
|----------------|---------------|
| HE 1           | 0.7908        |
| HE 2           | 0.8326        |
| HE 3           | 0.4932        |
| HE 4           | 0.6545        |
| HE 5           | 0.5136        |
| HE 6           | 0.5997        |
| HE 7           | 0.8892        |
| HE 8           | 0.9470        |
| HE 9           | 0.8672        |

Table 4.1.2 Hurst exponent tested values (controlled)

| Hurst exponent | Tested values |
|----------------|---------------|
| HE 1           | 0.5632        |
| HE 2           | 0.5854        |

The following are the tested values of log energy entropy. In the Table 4.1.9 and Table 4.1.10 below we have the values of log energy for one controlled and one alcoholic signal respectively.

Table 4.1.9 Log energy tested values (controlled)

| Log energy | Tested values |
|------------|---------------|
| LE 1       | -206.14       |
| LE 2       | -145.49       |
| LE 3       | 105.897       |
| LE 4       | 79.3229       |
| LE 5       | 136.1159      |
| LE 6       | 185.9579      |
| LE 7       | 105.6502      |
| LE 8       | 69.0639       |
| LE 9       | 44.6649       |

Table 4.1.10 log energy tested values (alcoholic)

| Log energy | Tested values |
|------------|---------------|
| LE 1       | -180.6060     |
| LE 2       | -211.4023     |
| LE 3       | 30.9622       |
| LE 4       | 59.1910       |
| LE 5       | 62.9901       |
| LE 6       | 60.2892       |
| LE 7       | 29.4430       |
| LE 8       | 41.8466       |
| LE 9       | 56.8049       |

In Table 4.1.11 we are going to show the values of log energy of different alcoholic signals.

Table 4.1.11 log energy tested values (alcoholic)

| S.No | LE1    | LE2    | LE3   | LE4    | LE5   | LE6    | LE7   | LE8   | LE9    |

The following are the tested values of norm entropy with  $P = 1.5$ .

In the Table 4.1.13 and Table 4.1.14 below we have the values of norm entropy for one controlled and one alcoholic signal respectively

Table 4.1.13 Norm entropy tested values (controlled)

| Norm entropy | Tested values |
|--------------|---------------|
| NE 1         | 692.2132      |
| NE 2         | 526.1381      |
| NE 3         | 441.1445      |
| NE 4         | 363.6924      |
| NE 5         | 307.3101      |
| NE 6         | 215.7663      |
| NE 7         | 147.5459      |
| NE 8         | 185.2892      |
| NE 9         | 422.5837      |

Table 4.1.14 Norm entropy tested values (alcoholic)

| Norm entropy | Tested values |
|--------------|---------------|
| NE 1         | 664.3496      |
| NE 2         | 489.2295      |
| NE 3         | 592.9529      |
| NE 4         | 568.5409      |
| NE 5         | 641.8377      |
| NE 6         | 1.0146 e+ 03  |
| NE 7         | 576.2522      |
| NE 8         | 634.4651      |
| NE 9         | 506.7367      |

In Table 4.1.15 we are going to show the values of norm entropy of different controlled signals.

Table 4.1.15 Norm entropy tested values (controlled)

| S.No | NE1   | NE2   | NE3   | NE4   | NE5   | NE6   | NE7   | NE8   | NE9   |

## 4.2 Accuracy using different classifiers

Table 4.2.1 shows the accuracy of Hurst exponent with receiver operating characteristics (ROC) curve [54] in Fig 4.2.1.

Table 4.2.1 Accuracy of Hurst exponent

| Type of classifier       | Accuracy |
|--------------------------|----------|
| Coarse Gaussian SVM [55] | 89.8%    |
| Logistic regression [56] | 84.2%    |
| Linear discriminant [56] | 83.1%    |
| Medium KNN [57]          | 86.4%    |
| Linear SVM [57]          | 89.2%    |

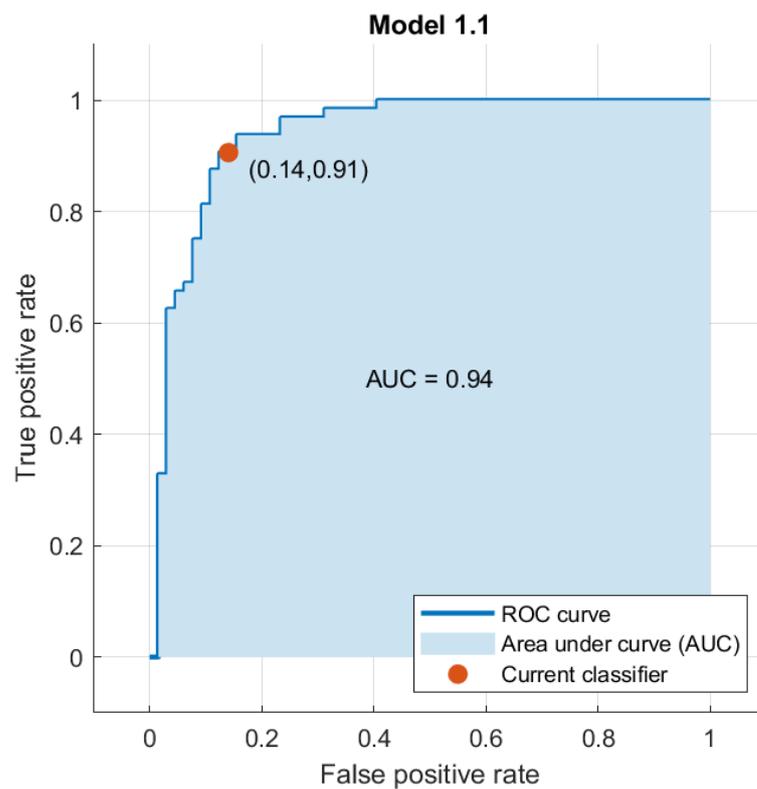

Figure 4.2.1 ROC of Hurst exponent

The following Table 4.2.2 shows the accuracy using Shannon entropy and ROC curve in Fig 4.2.2.

Table 4.2.2 Accuracy of Shannon entropy

| Type of classifier  | Accuracy |
|---------------------|----------|
| Coarse Gaussian SVM | 91.8%    |
| Logistic regression | 99.2%    |
| Linear discriminant | 95.1%    |
| Medium KNN          | 96.4%    |
| Linear SVM          | 92.2%    |

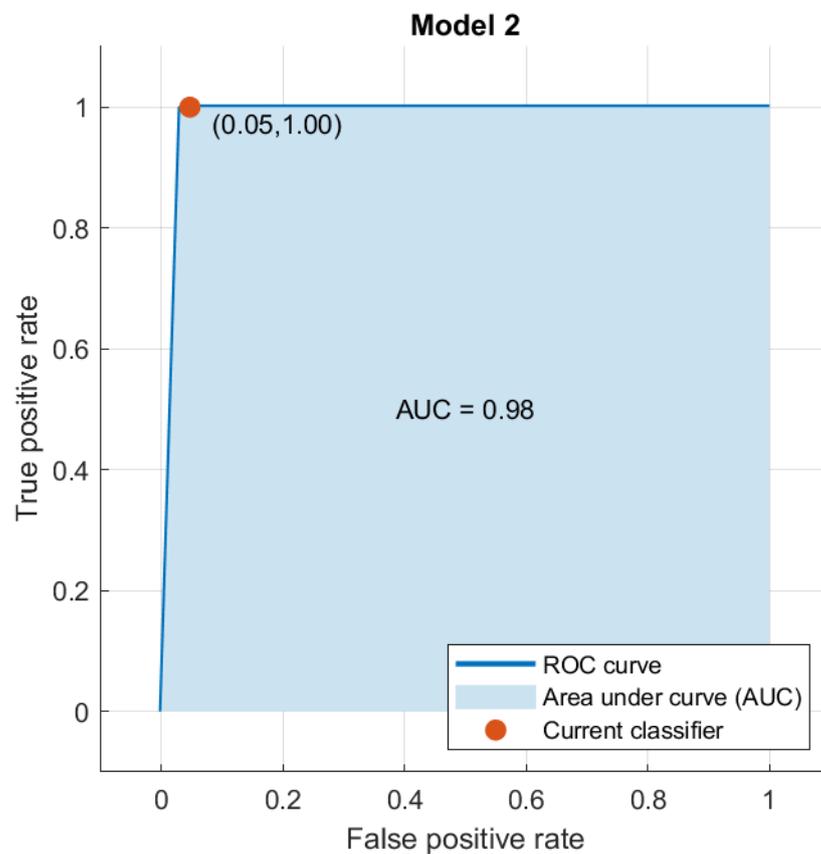

Figure 4.2.2 ROC of Shannon entropy

The following Table 4.2.3 shows the accuracy of log energy entropy and ROC curve in Fig 4.2.3.

Table 4.2.3 accuracy of log energy entropy

| Type of classifier  | Accuracy |
|---------------------|----------|
| Coarse Gaussian SVM | 91.8%    |
| Logistic regression | 94.2%    |
| Linear discriminant | 98.4%    |
| Medium KNN          | 96.8%    |
| Linear SVM          | 98.2%    |

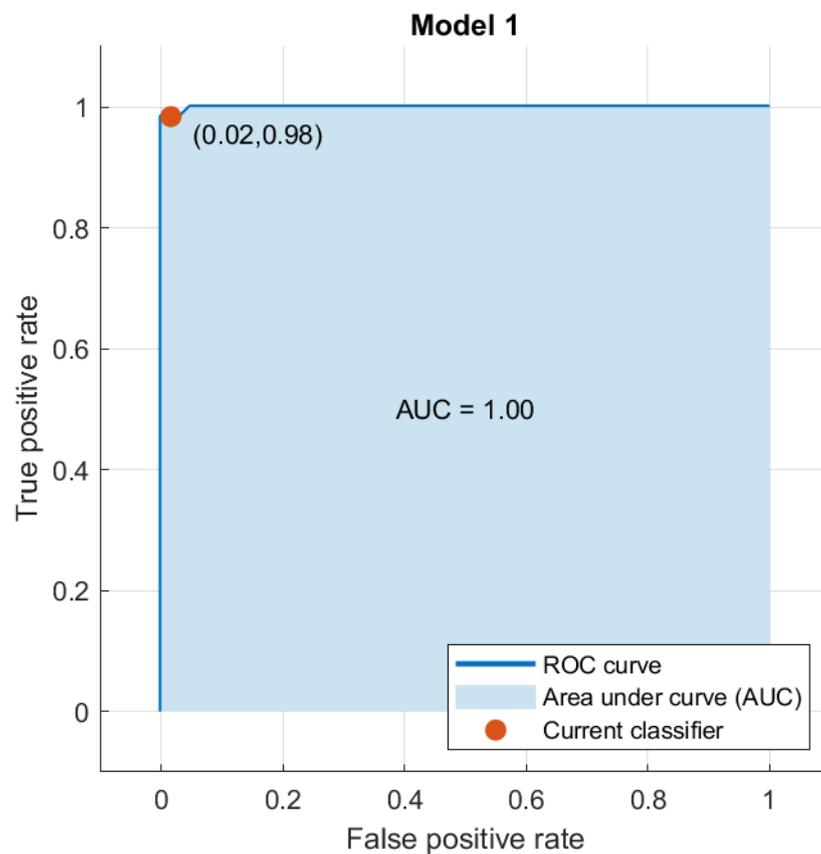

Figure 4.2.3 ROC of log energy entropy

The following Table 4.2.4 shows the accuracy of norm entropy with ROC curve in Fig 4.2.4.

Table 4.2.4 accuracy of norm entropy

| Type of classifier  | Accuracy |
|---------------------|----------|
| Coarse Gaussian SVM | 93.8%    |
| Logistic regression | 94.5%    |
| Linear discriminant | 93.1%    |
| Medium KNN          | 99%      |
| Linear SVM          | 90.2%    |

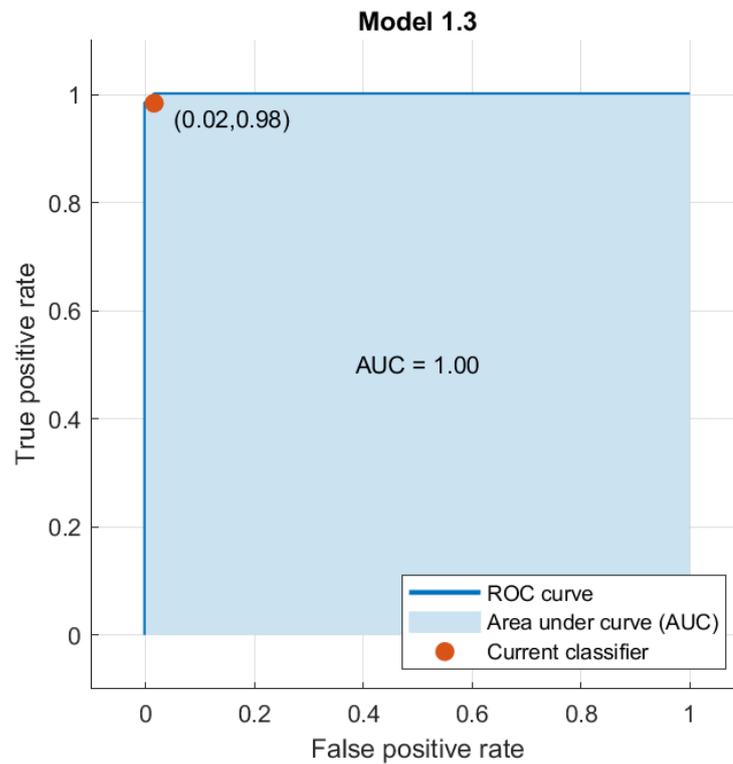

Figure 4.2.4 ROC of norm entropy

The following Table 4.2.5 shows the accuracy of threshold entropy with ROC curve in Fig 4.2.5

Table 4.2.5 Accuracy of threshold entropy

| Type of classifier  | Accuracy |
|---------------------|----------|
| Coarse Gaussian SVM | 91.8%    |
| Logistic regression | 94.2%    |
| Linear discriminant | 97.7%    |
| Medium KNN          | 96.1%    |
| Linear SVM          | 92.2%    |

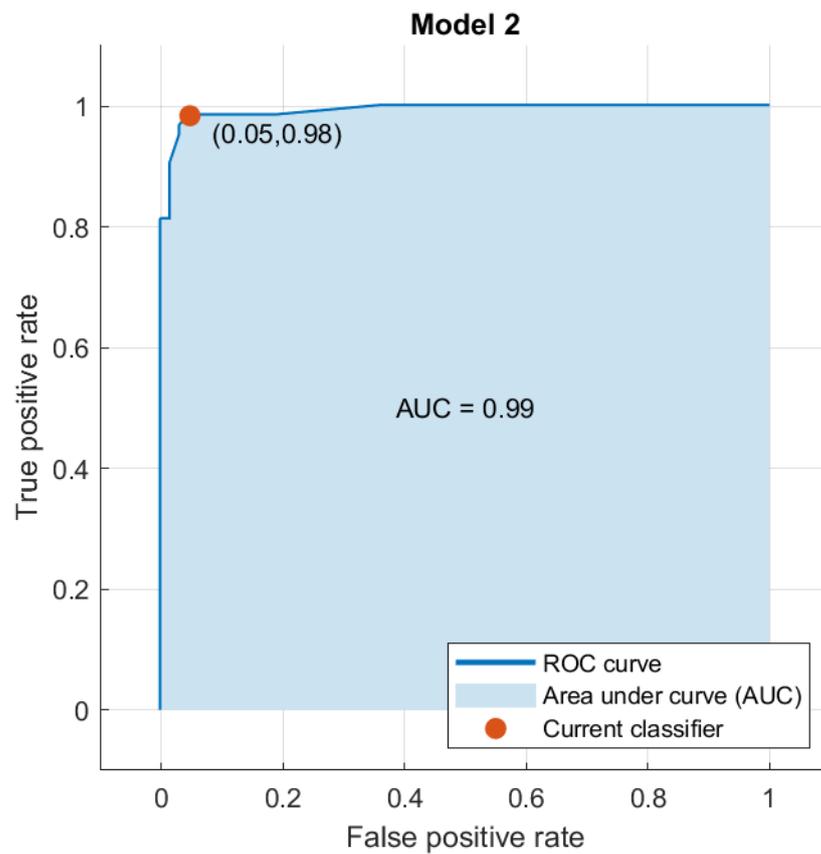

Figure 4.2.5 ROC of threshold entropy

### 4.3 Scatter plot and Confusion matrix

The following Figure 4.3.1 and Figure 4.3.2 are the Scatter plot and Confusion matrix of Hurst exponent respectively.

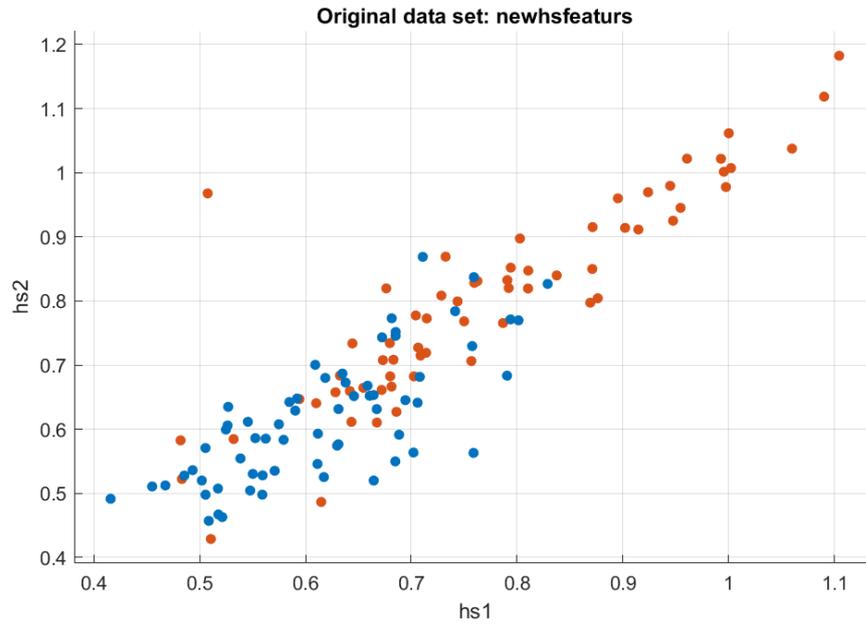

Figure 4.3.1 scatter plot of Hurst exponent

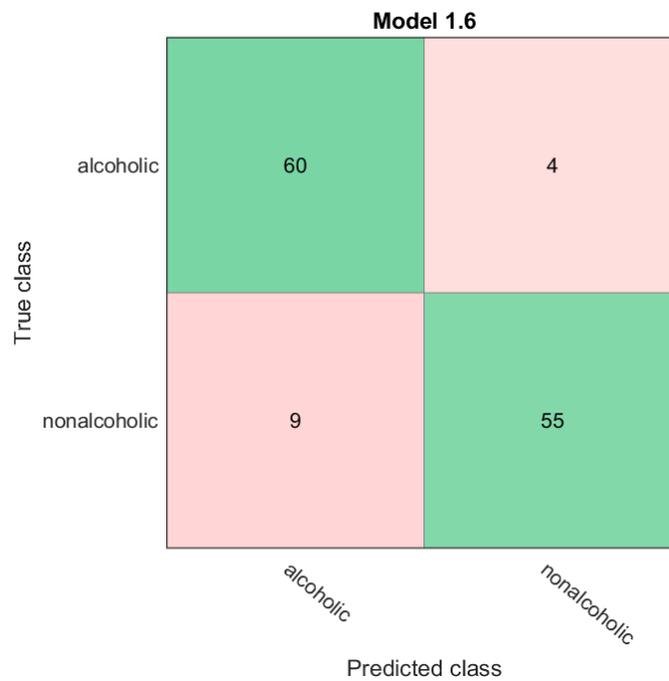

Figure 4.3.2 Confusion matrix of Hurst exponent

The following Figure 4.3.3 and Figure 4.3.4 are the scatter plot and confusion matrix of Shannon entropy respectively.

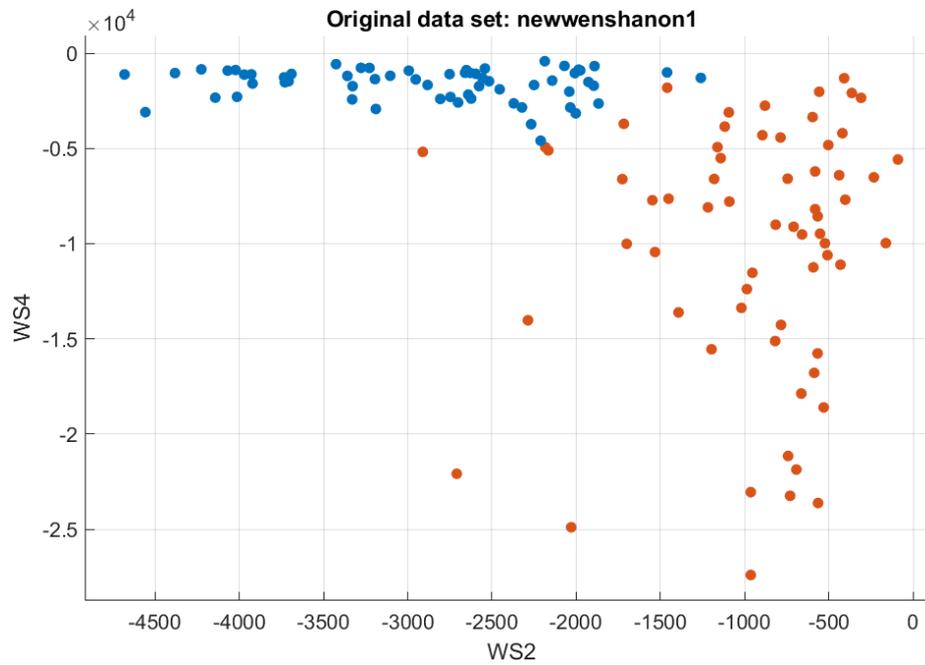

Figure 4.3.3 Scatter plot of Shannon entropy

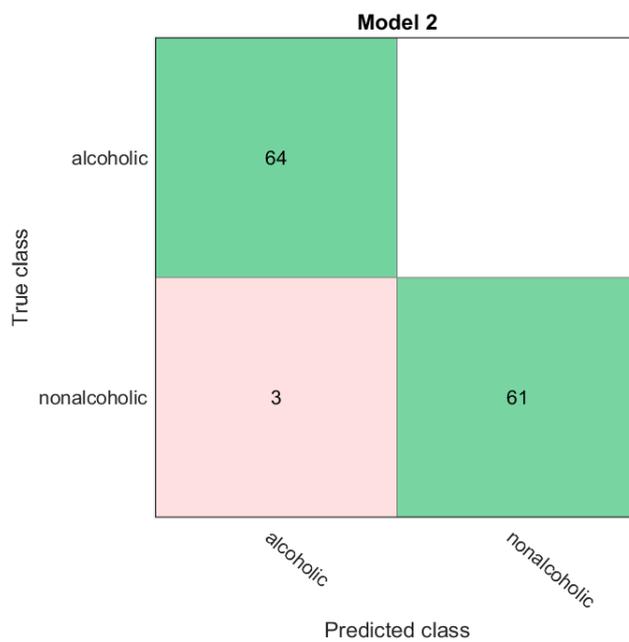

Figure 4.3.4 Confusion matrix of Shannon entropy

The following Figure 4.3.5 and Figure 4.3.6 are the scatter plot and confusion matrix of log energy entropy respectively.

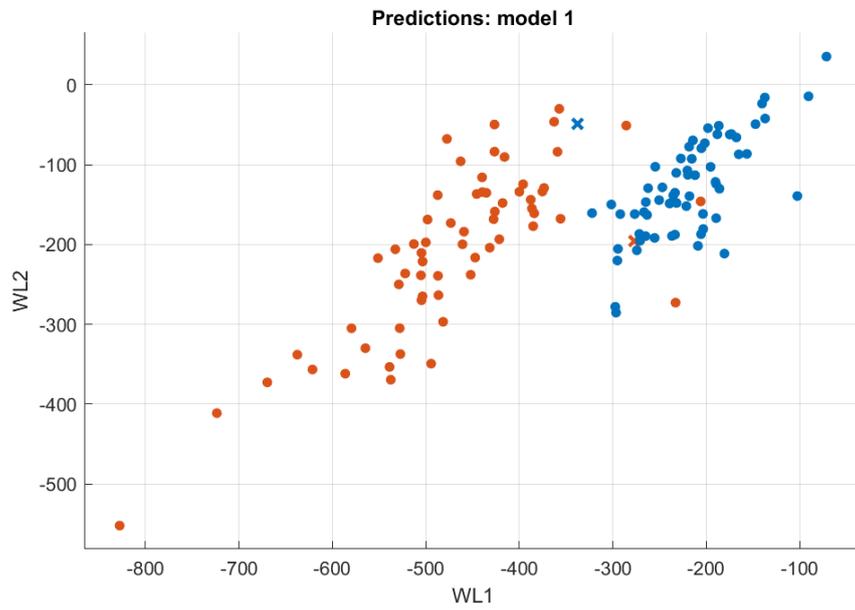

Figure 4.3.5 Scatter plot of log energy entropy

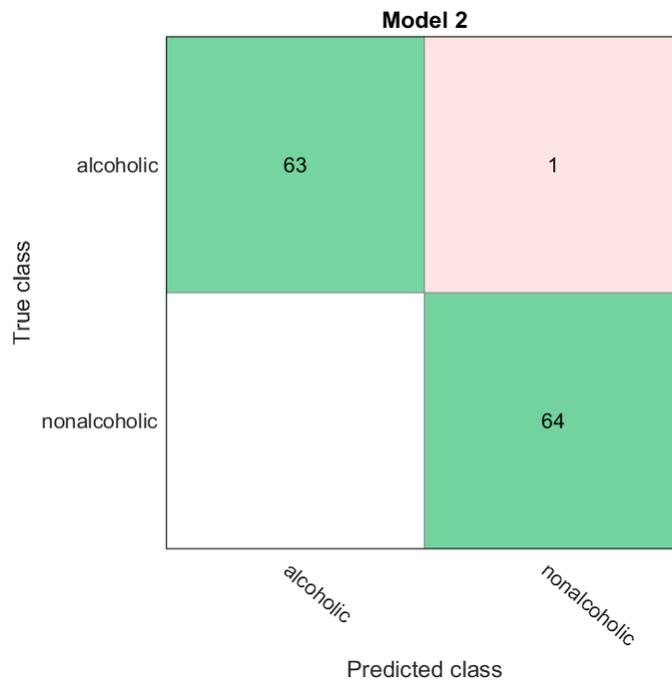

Figure 4.3.6 Confusion matrix of log energy entropy

The following Figure 4.3.7 and Figure 4.3.8 are the scatter plot and confusion matrix of norm entropy respectively.

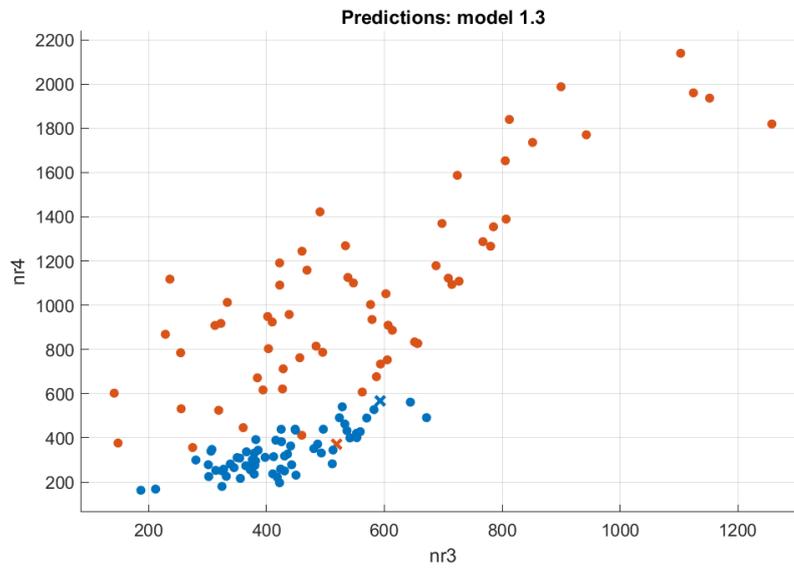

Figure 4.3.7 Scatter plot of norm entropy

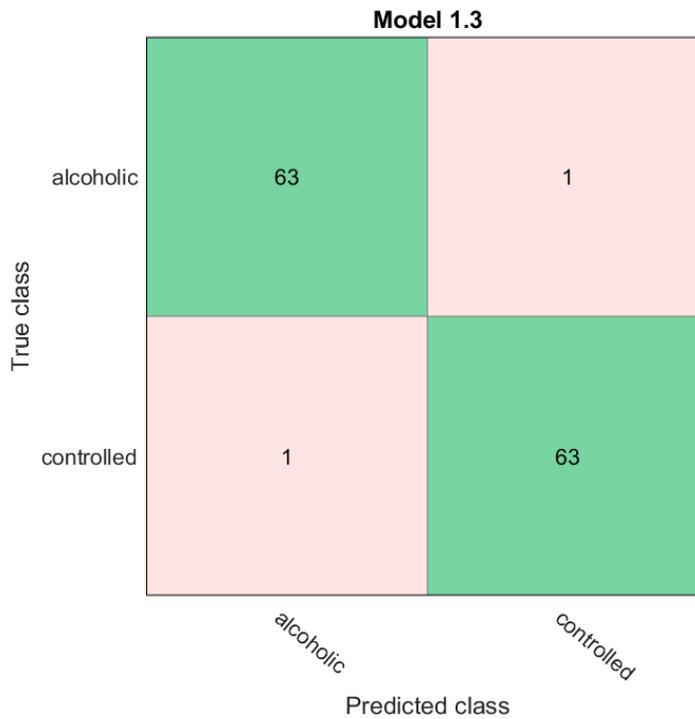

Figure 4.3.8 Confusion matrix of norm entropy

The following Figure 4.3.9 and Figure 4.3.10 are the scatter plot and Confusion matrix of threshold entropy respectively.

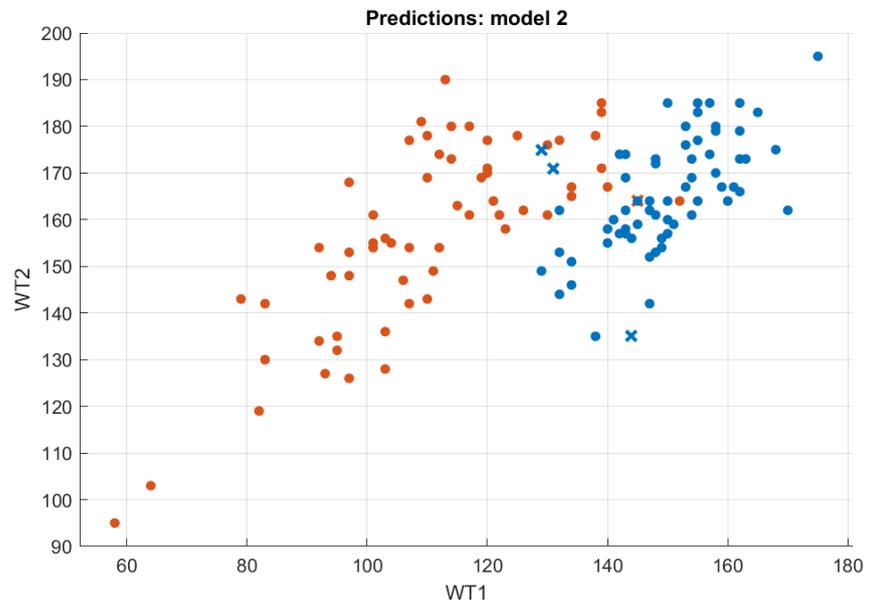

Figure 4.3.9 Scatter plot of threshold entropy

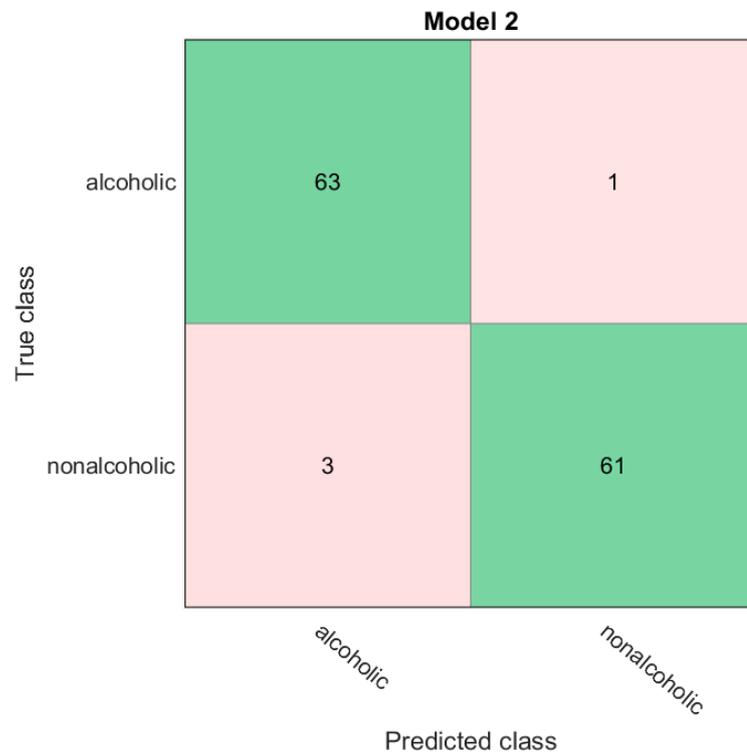

Figure 4.3.10 Confusion matrix of threshold entropy

From the above accuracy, ROC, scatter plot and confusion matrix we are getting the results as follows shown in Table 4.3.1.

Table 4.3.1 accuracy of features and classifiers

| <b>Name of the feature</b> | <b>Type of classifier used</b> | <b>accuracy</b> |
|----------------------------|--------------------------------|-----------------|
| <b>Hurst exponent</b>      | Coarse Gaussian SVM            | 89.8%           |
| <b>Shannon entropy</b>     | Logistic regression            | 99.2%           |
| <b>Log energy entropy</b>  | Linear discriminant            | 98.4%           |
| <b>Norm entropy</b>        | Medium KNN                     | 99%             |
| <b>Threshold entropy</b>   | Linear discriminant            | 97.7%           |

# **Chapter 5**

## **Conclusion and future scope**

### **5.1 Conclusion**

Finally, we have compared and proposed a new approach to identify the alcoholic and controlled EEG signals using TQWT and different feature extraction techniques and classifiers.

And from the above results we have got an accuracy of around 99.2% from Shannon entropy using logistic regression.

## **5.2 Future scope**

In this study we have used the data which is collected in 1990 using old technology we can record new data using present technology and with new classifier techniques we can achieve more accurate results.

And other features like fuzzy entropy and correntropy and PCA analysis can be used from getting more knowledge about classifying alcoholic and controlled.

Hardware can be designed for the proposed method and this method can be studied for various kinds of biomedical signals.
